NET CABLE 5E

Installing & Replacing the Wireless Package

The ThinkSign LED displays that are ordered with the wireless package are shipped pre-configured. The radios are meant to be plug-and-play, with little to no IT experience needed.

The Sender

- Plug a cable into the LAN port of the sender.
- Plug the POE unit power into the wall and plug the cable from the sending unit into the "POE" port.
- Plug a cable from the LAN port of the POE to an open port on your router or switch.
- Mount the sending unit and turn on the sign.
- After 2-3 minutes, the radios should sync up and you should be able to connect to your sign successfully after installing the Smart LED Manager Pro software.

The Receiver

- The receiver is configured and shipped with the unit and plugged into the master side of the sign.
- Plug in the cable marked "Wi-Fi" into the LAN port of the receiver.
- Next, mount the receiver vertically on an external area of the sign/pole facing the direction of the site the sender will be installed.

Wifi Communication Setup

Click on the sync button on the software homepage.

Next, click on the [Connection Guide](#)

The screenshot shows a software help window titled "Help". It features a "Connection Guide" section with two buttons: "How to Assign a Static IP Address" and "Ubiquiti M9000 Wireless Instruction". Below this is a "WiFi Device Discovery Tools" section with three columns, each containing a device image and a button: "EZ Net" with a white antenna, "EnGenius" with a white antenna, and "Ubiquiti" with a white antenna and the text "Need Java to run." at the bottom. At the very bottom of the window, there is a line of text: "If you still have a problem connecting click here to send an email, or call: 1-888-271-6807".
